You meet your students, you set expectations in the classroom, learning routines, and more. For these reasons, each mathematical package begins with an overview of mathematical standards from the previous class. This review helps students build trust and gives you more time to complete your morning duties. A spiraling mathematical examination is something that should be a daily routine in the classroom. If done consistently and efficiently, students should master all concepts to be learned by the end of the school year without stress and anxiety. What's your current routine? I want you to stop and think about your current morning job and/or math-warming routine. Ask yourself these questions: Are you sure your students are exposed to all standards throughout the year? Is what you use grab and go option or will you end up digging to find something to give them? Is your current routine differentiated to meet all student needs and levels in your classroom? [Spiralmath] My Reflections & Honesty When I think about the way I implemented my morning work or warming up in math it wasn't always all those things. This can be monotonous and therefore students lose interest. This usually leads to students rushing through their work and not always giving quality effort. If I'm being completely honest, I've also been known to scramble at the last minute to find something to find on their desk to fill in this time and provide a quick review. It wasn't always strategic and planned. The need for something better When I find a pain point in my classroom and I'm aware of it, I can't help but feel this burning desire to fix it and make it better. After visiting with some 2nd grade teachers in my Facebook group, I realized that I am not alone in this edition. Other teachers wanted a quick, grab-and-go, no preparatory option that met all the needs of all students as long as it covered all math standards throughout Spiral mathematical examination Sheets were born I joked with some teachers the other day that after the spiral mathematical examination sheets were finished, I felt like I had just given birth to a child! Yes, it can be a little drastic, but the amount of hours that have gone into this resource still makes me cry and feel all sorts of pride at the same time. Working with 15 other teachers I want to be fully transparent with you on this one. When the need for spiral math review sheets was placed on my plate, I knew I wanted this to be not only good, but excessive, knock-it-out-of-the-park amazing! So, I immediately reached out to my Facebook group and asked teachers if anyone was interested in helping to provide feedback, create and edit this resource. I was shocked. Unexpected response I gave a link to teachers to apply for this position, walked off the computer to dine with family, came back an hour later and found I had more than 300 teachers applying! I immediately turned off the connection and started going through the answers. Teachers with different classroom experience, teachers from all over the country, teachers with master's degree in math, teachers who are team leaders, teachers who served on their district's math board. .... the list goes on! No Doubt In My Mind After a few hours of carefully going through each person's app, I selected 15 teachers who I knew were perfect for the job. I'm not kidding when I say I never doubted this was a winning team of educators. It's time to get to work. We drew common core and Texas (TEKS) standards and started a conversation about the sequence of skills deployment throughout the year. We decided on a template we all liked. I created the first week of spiraling mathematical sheet examinations and immediately began receiving their feedback. Now, please, let me be clear in this section. I created the resource myself. These teachers have provided me with their high-quality feedback on the structure of the problem, suggestions for differentiation, as well as offering their incredible editing skills. This was a great advantage to the overall quality of resources. Daily Check Ins This amazing group of educators gave everything from yourself to 8 weeks. Every day they would log in, go through every problem and provide information. The finished product is something I am incredibly proud to have completed! 40 Weeks & 3 Levels of Differentiation Spiral Math Review has 40 weeks of sheets that vary by providing three levels for each week. The differentiation level is indicated in the upper-right corner of the sheet. Star=below heart=grade level at apple=above grade level Each sheet works on the same concept with different levels of complexity. Teachers love this option! \*\*Download your free spiral math review sheets here\*\* All standards are covered Another feature of this teachers like all common basic math standards to be covered throughout the year. In addition to common core standards, I had 2 teachers from Texas who helped me create TEKS-compliant supplemental sheets that are also included in this package. We also turned on the At a Glance section for a quick and easy reference. This section includes week numbers, included topics, and standards with which skills are aligned within the document. This makes for a very simple implementation process. When you use these spiral math review sheets are very versatile to use in the classroom. They can be used for the morning homework of math-warming math centers Spiraling is essential students can not be expected to learn the concept and master it without further exposure. That's why the spiral of concepts is key. Some other reasons that are spiraling are necessary; Students have the opportunity to fine-tun their skills for a well-rounded understanding of concepts. The pressure and need for a major review just before the big testing season will no longer be a problem. Research shows that the spiral of concepts increases the retention of mastery. It gives students the opportunity to master a concept that has not previously been mastered. Teachers can quickly analyze students' ability and evaluate concepts that need remediation. The Daily Spiral Math Review covers all standards, so students are exposed to concepts where they may not have had official instruction. This is an excellent opportunity to build background knowledge before teaching a specific lesson. Over time, students will experience increased self-confidence with their math skills.
